

The **DTCIRCLE TOKEN** is a digital tool on which the effects of a smart contract mature, that is a digital contract in Blockchain whose value legal is now officially recognized, thanks to its characteristics of unilateral immutability of the conditions.

Specifically, in the DTCircle, the BIG DATA generated by all the sharers of the community will be equally attributed by the Blockchain to each Token (rule of the smart contract), therefore each Token is representative the ownership of a portion of the BIG DATA generated by the system.

The company, therefore acts as an intermediary subject whose focus is on the procurement of the interested individual, in acquiring the BIG DATA generated by the system and the effects of the sale are attributed to the actual owner, that is the one who owns the Token.

The BIG DATA generated by the system are analyzed and categorized thanks to the intervention of an artificial intelligence (which verifies the content and profiling) that works in unison with the Blockchain which certifies its content, genesis and properties.

The sales phases of the BIG DATA are scheduled for the year 2020, ie completion of the technology development, already in an advanced stage, and reached the critical mass of Sharer of the community, necessary for the generation of transferable BIG DATA.

The BIG DATA can be proposed to all companies that are interested in acquiring them, in order to use them for the targeted promotion of their services and products.

The price of the single Token is fixed at € 1 during the pre-launch phase.
